

EN VI RO MO DAL, adj:

being or involving transportation by more than one carrier using a single shared asset resulting in a healthier environment.

In a time when fuel prices have reached record highs, shippers are looking to squeeze every transportation dollar, and motor carriers are trying to reduce their empty miles, everyone in the supply chain has also been challenged with looking for a new and greener transportation model.

EnviroModal is that new model. EnviroModal is a collaboration of providers offering clients logistical transportation efficiencies while at the same time reducing greenhouse gasses and air pollution. It accomplishes this by working with shippers and logistical partners to reload empty intermodal, railcar, and maritime transportation capacity creating a more efficient global network.

EnviroModal's staff of experienced, creative, and highly talented professionals are strong believers in providing better transportation for a healthier world. Our leadership has grown through the ranks and knows first-hand what it takes to meet the challenges of today's transportation demands. There is no other organization that is more dedicated and enthusiastic to providing the right services for our vendors and our customers.

a new way of thinking about freight transportation and the environment

enviromodal.com

intermodal services

A single intermodal train can remove 280 trucks (equivalent to 1,100 automobiles) from the highways, easing pollution, saving energy, and reducing highway congestion all at the same time. In 2006 railroads

removed more than 12 million trucks from the highways – the equivalent of almost 50 million automobiles.

Enviromodal currently offers two programs, Greenleaf and Genesis. These programs offer a neutral, shared intermodal asset, made available to IMCs and 3PL's via REZ-1's ChannelSpeed application. Enviromodal programs are managed 24/7 by a motivated, environmentally friendly team of transportation professionals.

By utilizing Enviromodal programs you can help eliminate harmful and wasteful empty highway miles while having a positive impact on our environment. Contact us today to get signed up.

eliminate empty highway miles and reduce carbon emissions with enviromodal

freight rail services

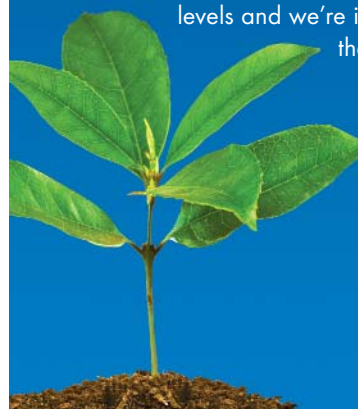

Freight trains move a ton of freight an average of 423 miles on a single gallon of diesel fuel and have increased their fuel efficiency by 80 percent over the past 25 years.

Because a freight train is more than three times as fuel efficient as other modes of transportation, shifting just 10 percent of long-haul freight would reduce fuel consumption by more than 1 billion gallons a year.

Every day Enviromodal is working with customers to help convert their freight into railcar traffic. We have crafted agreements that take advantage of the environmentally-friendly efficiencies and monetary savings that railcars offer clients. Rail shipments, cross-docking, and final deliveries can all work together to reduce costs, reduce congestion, and reduce greenhouse gasses.

Never Shipped by rail before? The Enviromodal team removes the complexities and makes it easy for our clients to utilize. Our staff has been involved with the railroad at all levels and we're in your corner. We understand the questions asked and provide the necessary information that allows us to maximize your transportation dollars.

lower your shipping costs while you reduce our dependency on oil

maritime services

International trade is projected to reach two billion tons within the next 20 years –twice today's level. This increase will place significant stress on an already overloaded landside transportation system. Maritime

transportation, especially along our coasts and inland waterways is a sensible, economical, and environmentally friendly transportation solution.

Enviromodal is aggressively working with ports and water carriers to develop container barge services that will utilize under-capacity ports and infrastructure reducing transportation congestion along the East Coast. Stay tuned as we develop this exciting program.

environmentally friendly, cost competitive, and fuel efficient

technology

The cornerstone of Enviromodal's innovative services is its use of interactive technology. We take pride in the belief that our customers should be engaged in the management of their freight. Ordering intermodal equipment is made easy through the dynamic web based systems of REZ-1. No longer do clients have

to call around asking for equipment and availability of transportation capacity. Our database of terminal locations and real-time asset information provides up to the minute information. It's all right there, on-line, and easy to use.

Enviromodal's technology center allows us to optimize our clients' transportation needs by monitoring and managing all shipments. Though our in-house network, we are able to work with individual clients in managing the full life cycle of shipments from quote to

shipment planning and from shipment monitoring to financial settlement with all parties in the supply chain. And being environmentally aware, means all bills of lading, freight payments, and assessorial management are handled electronically.

All of these technological applications are backed up with our trained support staff. They work in unison to provide our customers with the most robust transportation options and network in the market today.
